Basal bulb rot Atmospheric temperature: 25°C to 32°C, Soil temperature: 25°C to 28°C along with high soil moisture; relative humidity above 70% and Dry atmospheric competation and the surface water stagnation (5 to 10 mm per day)	59.0 52.0
Stage Seedling raising & Transplanting vegetative growth Flowering & fruiting Harve Favorable environment Temperature 10°C to 30°C The optimum temperature for vegetative phase is 13-24°C is 15-25°C Relative Humidity Relative Humidity Favorable environment A wide range of soil temperatures from 20°C to 35°C, with the optimum at 24°C Sunshine Hour 9 to 10 hours 9 to 10 hours Favorable environmental conditions for insects and diseases Thrips Hot and dry weather increases Trips population; Heavy rainfall reduces population; RH:47.6% to 78.62% Purple blotch Warm temperature for vegetative provided in the population of the population	208 186
Stage Seedling raising & Transplanting vegetative growth Flowering & fruiting Harve Favorable environment Temperature 10°C to 30°C The optimum temperature for vegetative is15-25°C Relative Humidity Requires about 70% relative humidity for good growth Soil Temperature A wide range of soil temperatures from 20°C to 35°C, with the optimum at 24°C Sunshine Hour 9 to 10 hours 10 to 12 hours Favorable environmental conditions for insects and diseases Thrips Hot and dry weather increases Trips population; Heavy rainfall reduces population; RH:47.6% to 78.62% Common cut worm Favorable of very low temperature and high relative humidity; The upper development threshold temperature for all stages is 37°C; RH:50% to 90% Purple blotch Warm temperature (21°C to 30°C); High humidity (80% to 90%); Moderate to heavy frequent rainfall and heavy dew during growing stage causes prolonged leaf wetness (12 hours or more) favored disease development. Basal bulb rot Atmospheric temperature: 25°C to 32°C; Soil temperature: 25°C to 28°C along with high soil moisture; relative humidity above 70% and Dry atmospheric competitions in surface water stagnation (5 to 10 mm per day) Heavy-rainfall events in short spells result in surface water stagnation (5 to 10 mm per day)	5.6 5.6
Favorable environment Temperature 10°C to 30°C The optimum temperature for vegetative phase is 13-24°C Relative Humidity Requires about 70% relative humidity for good growth Soil Temperature A wide range of soil temperatures from 20°C to 35°C, with the optimum at 24°C Sunshine Hour 9 to 10 hours Favorable environmental conditions for insects and diseases Thrips Hot and dry weather increases Trips population; Heavy rainfall reduces population; RH:47.6% to 78.62% Common cut worm Favored by low temperature and high relative humidity; The upper development threshold temperature for all stages is 37°C; RH: 50% to 90% Purple blotch Warm temperature (21°C to 30°C); High humidity (80% to 90%); Moderate to heavy frequent rainfall and heavy dew during growing stage causes prolonged leaf wetness (12 hours or more) favored disease development. Basal bulb rot Weather warning Rainfall (mm) Heavy-rainfall events in short spells result in surface water stagnation (5 to 10 mm per day)	
Temperature 10°C to 30°C The optimum temperature for vegetative phase is 13- 24°C	ting
Relative Humidity Requires about 70% relative humidity for good growth Soil Temperature A wide range of soil temperatures from 20°C to 35°C, with the optimum at 24°C Sunshine Hour 9 to 10 hours 10 to 12 hours Favorable environmental conditions for insects and diseases Thrips Hot and dry weather increases Trips population; Heavy rainfall reduces population; RH:47.6% to 78.62% Common cut worm Favored by low temperature and high relative humidity; The upper development threshold temperature for all stages is 37°C; RH: 50% to 90% Purple blotch Warm temperature (21°C to 30°C); High humidity (80% to 90%); Moderate to heavy frequent rainfall and heavy dew during growing stage causes prolonged leaf wetness (12 hours or more) favored disease development. Basal bulb rot Atmospheric temperature: 25°C to 32°C; Soil temperature: 25°C to 28°C along with high soil moisture; relative humidity above 70% and Dry atmospheric or Weather warning Rainfall (mm) Heavy-rainfall events in short spells result in surface water stagnation (5 to 10 mm per day)	
Soil Temperature Sunshine Hour 9 to 10 hours 10 to 12 hours Favorable environmental conditions for insects and diseases Thrips Hot and dry weather increases Trips population; Heavy rainfall reduces population; RH:47.6% to 78.62% Common cut worm Favored by low temperature and high relative humidity; The upper development threshold temperature for all stages is 37 °C; RH: 50% to 90% Purple blotch Warm temperature (21°C to 30 °C); High humidity (80% to 90%); Moderate to heavy frequent rainfall and heavy dew during growing stage causes prolonged leaf wetness (12 hours or more) favored disease development. Basal bulb rot Atmospheric temperature: 25°C to 32°C; Soil temperature: 25°C to 28 °C along with high soil moisture; relative humidity above 70% and Dry atmospheric composition. Heavy-rainfall events in short spells result in surface water stagnation (5 to 10 mm per day)	is more suitable
Sunshine Hour 9 to 10 hours 10 to 12 hours Favorable environmental conditions for insects and diseases Thrips Hot and dry weather increases Trips population; Heavy rainfall reduces population; RH:47.6% to 78.62% Common cut worm Favored by low temperature and high relative humidity; The upper development threshold temperature for all stages is 37 °C; RH: 50% to 90% Purple blotch Warm temperature (21°C to 30 °C); High humidity (80% to 90%); Moderate to heavy frequent rainfall and heavy dew during growing stage causes prolonged leaf wetness (12 hours or more) favored disease development. Basal bulb rot Atmospheric temperature: 25°C to 32°C; Soil temperature: 25°C to 28 °C along with high soil moisture; relative humidity above 70% and Dry atmospheric companies. Rainfall (mm) Heavy-rainfall events in short spells result in surface water stagnation (5 to 10 mm per day)	
Thrips Hot and dry weather increases Trips population; Heavy rainfall reduces population; RH:47.6% to 78.62% Common cut worm Favored by low temperature and high relative humidity; The upper development threshold temperature for all stages is 37 °C; RH: 50% to 90% Purple blotch Warm temperature (21°C to 30 °C); High humidity (80% to 90%); Moderate to heavy frequent rainfall and heavy dew during growing stage causes prolonged leaf wetness (12 hours or more) favored disease development. Basal bulb rot Atmospheric temperature: 25°C to 32°C; Soil temperature: 25°C to 28 °C along with high soil moisture; relative humidity above 70% and Dry atmospheric companies. Rainfall (mm) Heavy-rainfall events in short spells result in surface water stagnation (5 to 10 mm per day)	
Thrips Hot and dry weather increases Trips population; Heavy rainfall reduces population; RH:47.6% to 78.62% Common cut worm Favored by low temperature and high relative humidity; The upper development threshold temperature for all stages is 37 °C; RH: 50% to 90% Purple blotch Warm temperature (21°C to 30 °C); High humidity (80% to 90%); Moderate to heavy frequent rainfall and heavy dew during growing stage causes prolonged leaf wetness (12 hours or more) favored disease development. Basal bulb rot Atmospheric temperature: 25°C to 32°C; Soil temperature: 25°C to 28 °C along with high soil moisture; relative humidity above 70% and Dry atmospheric companies. Rainfall (mm) Heavy-rainfall events in short spells result in surface water stagnation (5 to 10 mm per day)	
Common cut worm Favored by low temperature and high relative humidity; The upper development threshold temperature for all stages is 37 °C; RH: 50% to 90% Purple blotch Warm temperature (21°C to 30 °C); High humidity (80% to 90%); Moderate to heavy frequent rainfall and heavy dew during growing stage causes prolonged leaf wetness (12 hours or more) favored disease development. Basal bulb rot Atmospheric temperature: 25°C to 32°C; Soil temperature: 25°C to 28 °C along with high soil moisture; relative humidity above 70% and Dry atmospheric companies. Rainfall (mm) Heavy-rainfall events in short spells result in surface water stagnation (5 to 10 mm per day)	
causes prolonged leaf wetness (12 hours or more) favored disease development. Basal bulb rot Atmospheric temperature: 25°C to 32°C; Soil temperature: 25°C to 28 °C along with high soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture in the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dry atmospheric compact of the soil moisture; relative humidity above 70% and Dr	
Weather warning Heavy-rainfall events in short spells result in surface water stagnation (5 to 10 mm per day)	
Rainfall (mm) Heavy-rainfall events in short spells result in surface water stagnation (5 to 10 mm per day)	ditions
Ola	
Cloudy weather Cloudy weather	
Drought 7 to 10 days Duration of stay wet (day) 3 to 5 days 2 to 3 days	
Hailstorms Hailstorms with seasonal rainfall	
Wind speed (Km/hr.) ≥ 16 km/hr	-
Temperature (°C) Above 35°C
